(30 Marks)
As many websites have discount coupon our main aim is to make similar to that
In which we have to create page on the basis of Category like,
Cloths, Electronics etc
On the each category you have to provide list of coupons
(either create own api or use json server)

(20 marks)
Coupon code is only visible after click on selected Coupon,  on click it will show one QR
code(resources have some link to generate or use any of your own)
User will scan Qr code from mobile and click next,  on next page there is option to validate
coupons
Now customer have to enter coupon code

(30 marks)
From your side (either from db or from json file)  you have to validate
Every coupon code have must have expiry time and code number
In your data you should have same code must be present,  in case coupon  is valid take to
particular website
Like for amazon open amazon website on next page
Else say code not valid

In your data set you must have some expiry coupons also to validate
